Agents move; accountability must remain

Agent execution can differ by runtime while organizational oversight remains consistent.

Agents can move between runtimes; organizational accountability should not disappear when they do.

An execution platform is well positioned to inspect the agents it hosts. It does not automatically see an agent creat service, a local automation, or a broker coordinating workers across providers.

Platform dashboards fragment the operating picture

When the organization adopts multiple platforms, platform-specific records produce different definitions of what a may approve its work.

An organizational agent record should capture identity, purpose, human ownership, process, constraints, depender and accepted changes. Its execution platform remains an important attribute, not the sole source of authority.

This separation also makes migrations easier to reason about: changing a model or runtime need not silently redefi authorization granted to the agent.

Three platforms, three partial inventories

> **EXAMPLE**
>
> Marketing operates agents in one SaaS platform, engineering in another, and finance uses an E embedded assistant. Each platform presents a different definition of “managed.”

Decide which management facts must remain portable even if an underlying platform, vendor, or orchestration app

The decisive question is not simply whether the agent can carry out the task. It is whether the organization underst the operating arrangement in which it does so.

Separate management definitions from agent runtimes

As agents move between platforms, their accepted responsibilities and evidence should remain access

For connected agents, management can be driven by an agent-facing interface. Where direct access is not possible trusted synchronizer could periodically gather and submit definitions. Such an integration must establish identity a prevent unauthorized acceptance, and record stale or incomplete results.

The orchestrator pattern is a viable design direction rather than a claim that every enterprise connector already exis

Validate context, assess consequ accept decisions.

A substrate-neutral definition can provide shared language for purpose, scope, owner, risk, and acceptance without the agent runs.

That architecture gives companies an option to change providers while retaining a stable basis for accountability.

Identity, purpose, authority, limits and accountability remain organizational responsibilities.

Use the comparison to test one real agent rather than discussing an abstract enterprise-wide target state. Where th unknown, record that uncertainty and assign responsibility for resolving it.

What should remain independent of the platform?

> Management portability is the freedom to change technology without losing the decisions that operation legitimate.

The first practical improvement is to create one current, accountable record and use it to make a better manageme scalable system follows when that discipline is repeated across agents and maintained as conditions change.
